Entity-Relationship Model

Entity-Relationship Model

ENTITIES

- Person
 - SSN (Identifier)
 - Name
 - Birth-Date
 - Beginning Date
- Address
 - Type (discriminator)
 - Street
 - City
 - State
 - Zip
- Faculty
 - SSN (Identifier)
 - Contact hours
 - Tenure status
- Staff
 - SSN (Identifier)
 - Position
- Student
 - SSN (Identifier)
 - Overall GPA
 - Major

ENTITIES

Entity-Relationship Model

- Dept.
 - Dept-Code (ID)
 - Dept-Name
 - Dept-Address
 - Dept-Chair
- Course
 - Crse-Code (ID)
 - Crse-Title
 - Crse-Max-Credit-Hours
 - Crse-Var-Hours-Code
 - Crse-Fee
- Section
 - Sect-Code (ID)
 - Sect-Credit-Hours
 - Sect-Meet-Time
 - Sect-Meet-Day
- Semester
 - Sem-Yr (ID)
 - Sem-Session (ID)

Entity-Relationship Model

RELATIONSHIPS with attributes

- Student enrolled-in Section
 - Credit-hours
 - In a variable credit section this attribute would be used to hold the credit hours for which a specific student is enrolled.
- Completed
 - Grade
 - A student is allowed to take a course more than once.

ER to Relational Conversion

- 1 Consider all strong entities not subtypes
(do not consider “date” entities here)
- 2 Consider sub-type entities
 - two methods
- 3 Consider weak entities
- 4 Consider One-to-many binary relationships

ER to Relational Conversion

- 5 Consider many-to-many binary relationships
- 6 Consider relationships greater than binary (other than those involving “date” entities)
- 7 Consider relationships greater than binary involving a “date” entity
- 8 Consider recursive relationships

Consider All Strong Entities not Subtypes

- create a new relation
- name of the relation is the name of the entity
- attributes of entity become attributes of relation
- primary key of relation is entity identifier

Consider All Strong Entities not Subtypes

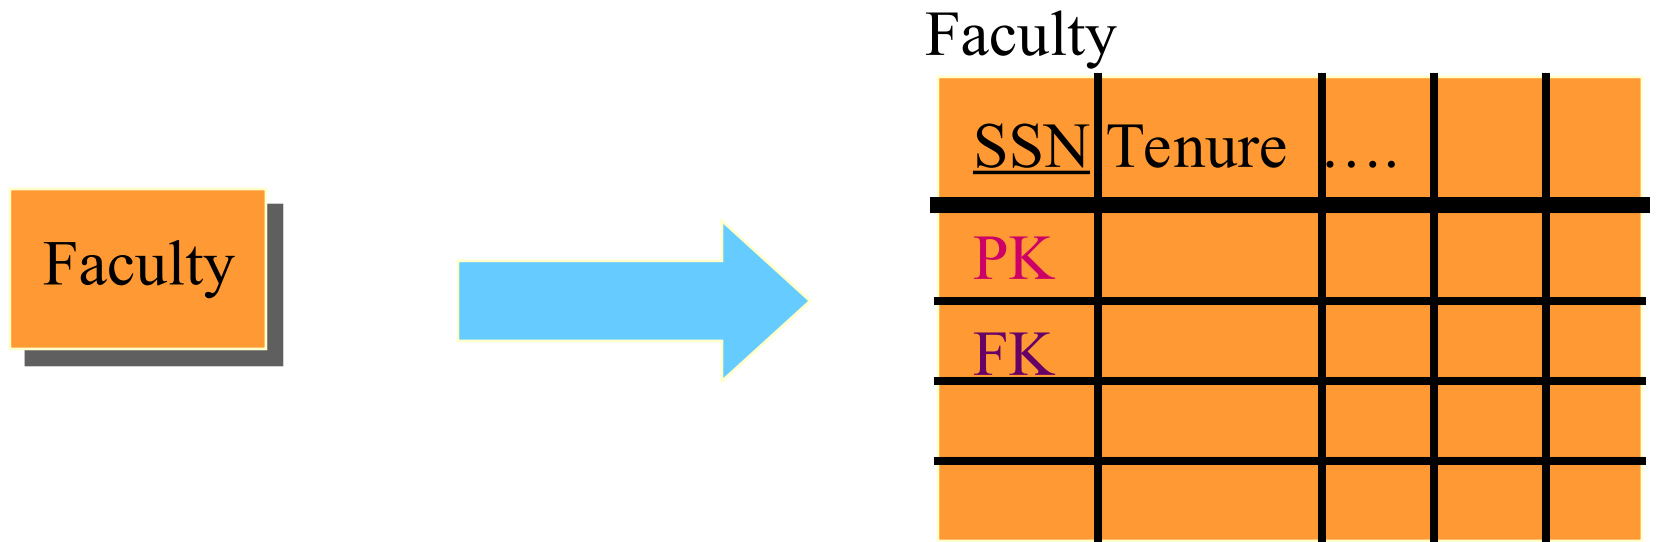

Person

<u>SSN</u>	Name		
PK				

Consider Sub-type Entities (First Method)

- treat as a strong entity
- primary key is the entity identifier
- primary key is also a foreign key
referencing the relation created from
the supertype entity

Consider Sub-type Entities (First Method)

Consider Sub-type Entities (Second Method)

- combine into the relation created from the supertype entity as a composite attribute

Consider Sub-type Entities

- may combine the two methods within the conversion of the sub-types of a single ISA

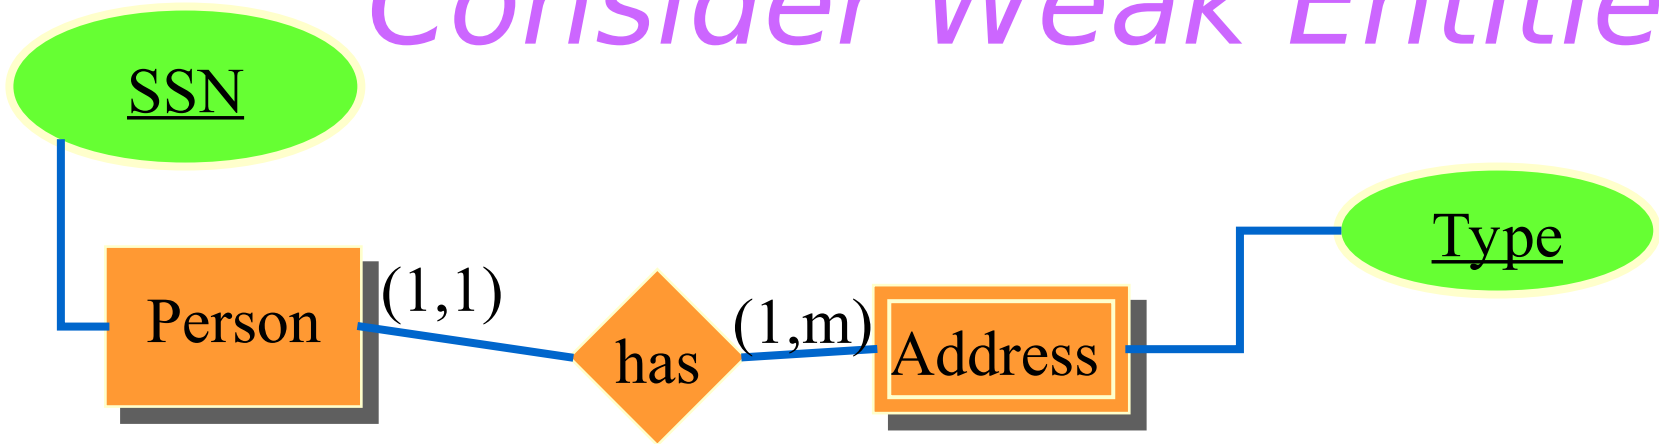

Consider Weak Entities

- create a new relation
- name of the relation is the name of the weak entity
- attributes of entity become attributes of relation

Consider Weak Entities

- primary key of the relation is the concatenation of the primary key of the relation created from the strong entity and the discriminator of the weak entity
- the attribute which is the primary key of the relation created from the strong entity is also a foreign key

Consider Weak Entities

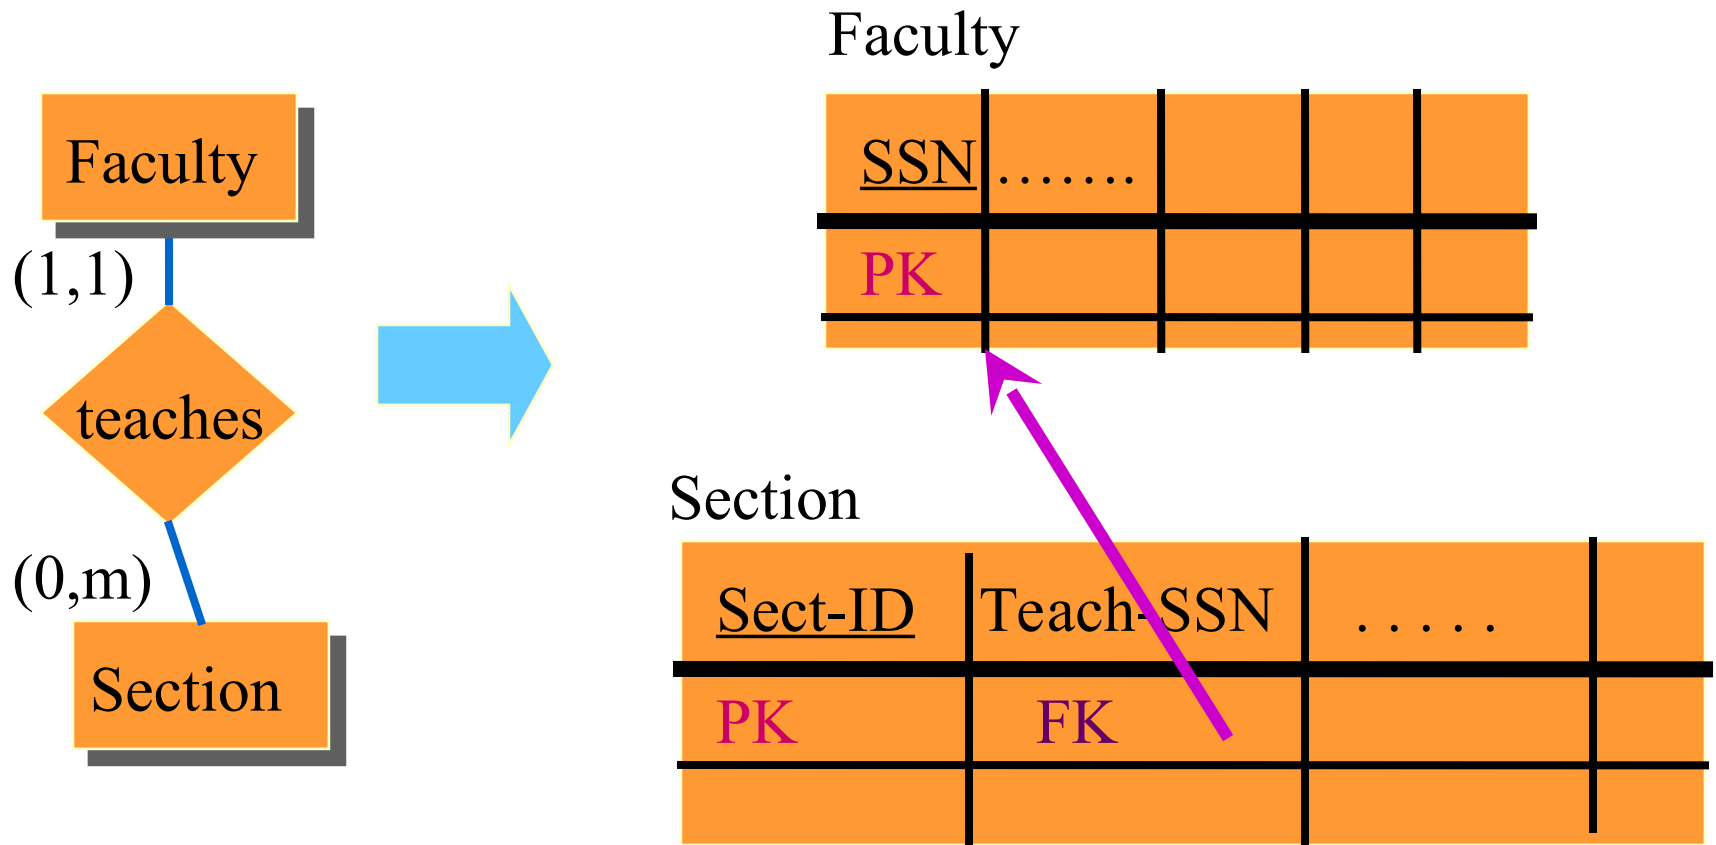

Address

<u>SSN</u>	<u>Type</u>	...		
PK	PK			
FK				

Consider One-to-many Binary Relationships

- The primary key of the relation created from the “one” entity becomes a foreign key in the relation created from the “many” entity.

Consider One-to-many Binary Relationships

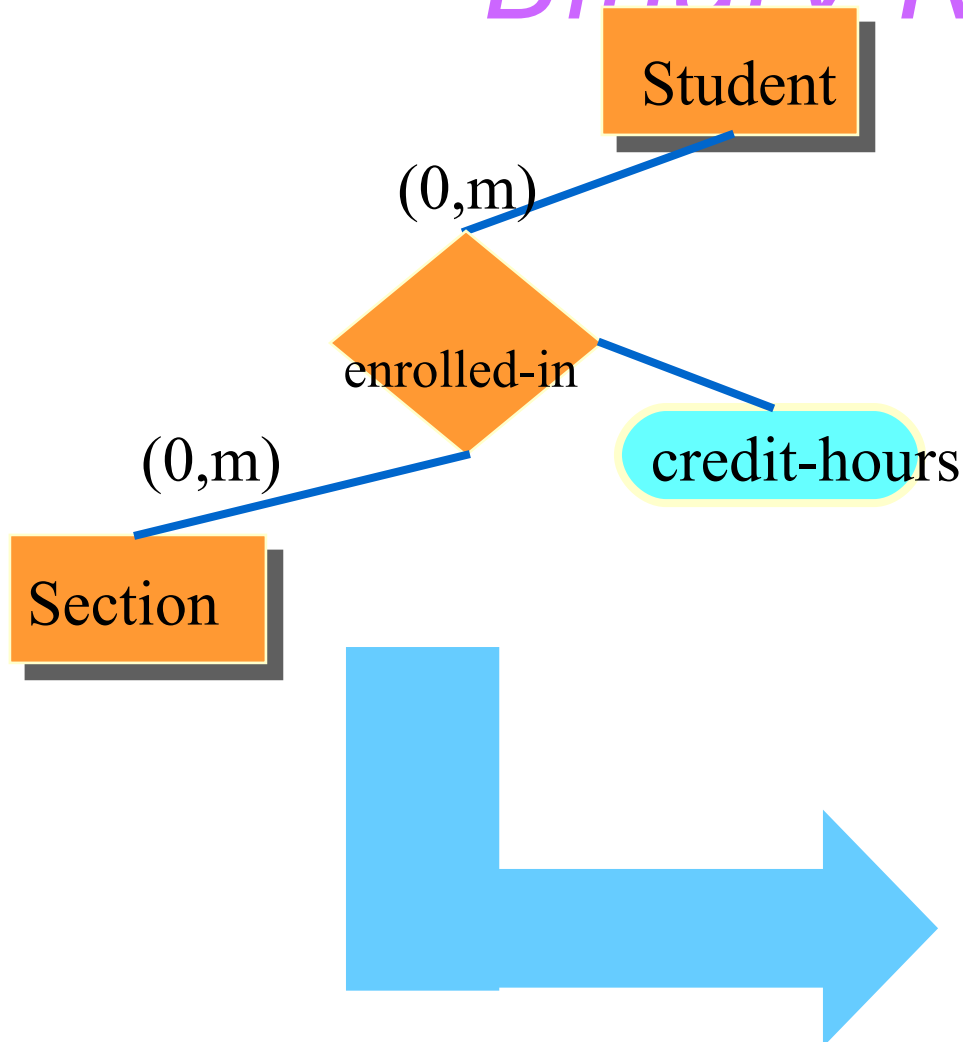

Consider Many-to-many Binary Relationships

- Create a new relation for the relationship whose primary key is the concatenation of the entity-ids of the related entities.
- The primary key attributes are also foreign keys into the relations created from the related entities.

Consider Many-to-many Binary Relationships

- The name of the new relation should reflect the relationship name.
- The intersection data of the relationship become non prime attributes of the relation.

Consider Many-to-many Binary Relationships

enrolled-in

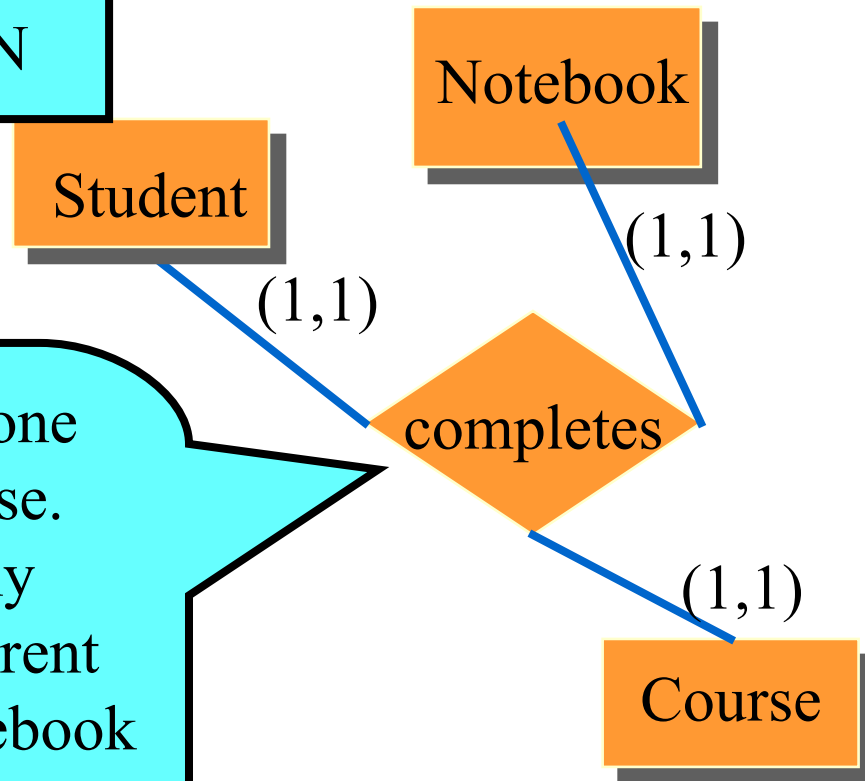

<u>SSN</u>	<u>Sect-ID</u>	Credit-hours
PK	PK	
FK	FK	

Consider Relationships Greater than Binary

- Create a new relation for the relationship.
- The primary key of the new relation depends upon the cardinalities of the relating entities.

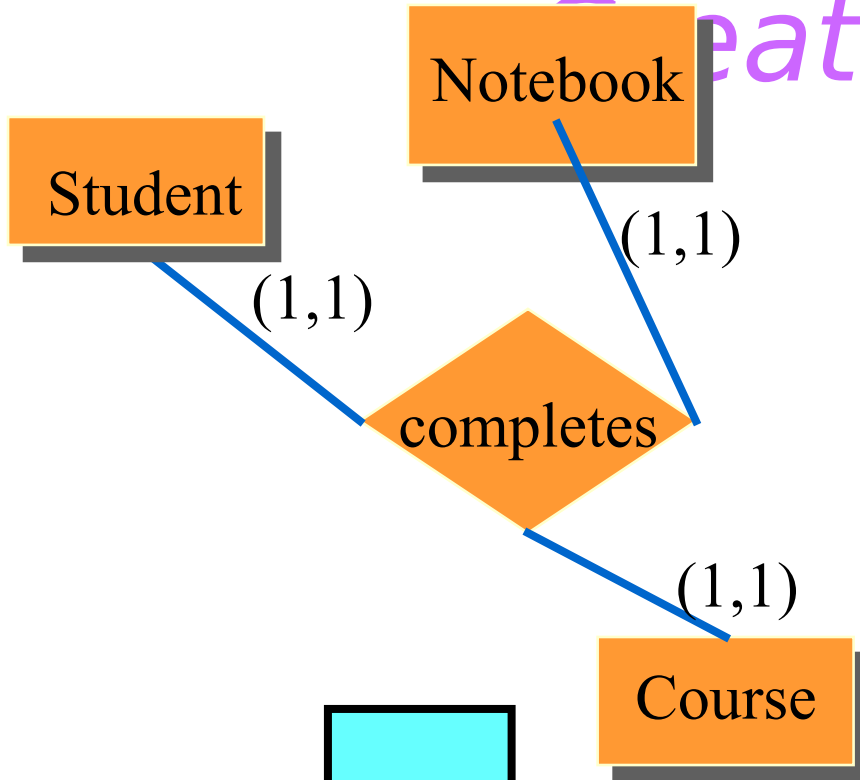

Consider Relationships Other than Binary

SSN, Crse-ID \rightarrow Notebook-ID
SSN, Notebook-ID \rightarrow Crse-ID
Crse-ID, Notebook-ID \rightarrow SSN

A student used exactly one notebook for each course.
He/she may be in many courses with many different notebooks. But each notebook belongs to one student and one course.

Consider Relationships Greater than Binary

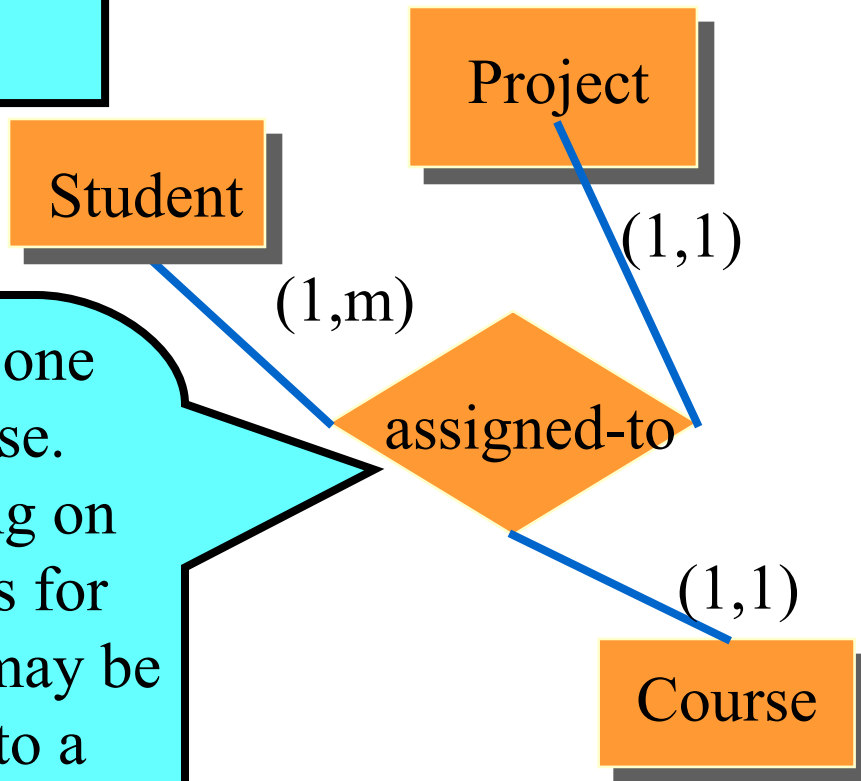

One Possibility

Completes		
<u>SSN</u>	<u>Crse-ID</u>	Notebook-ID
PK	PK	
FK	FK	FK

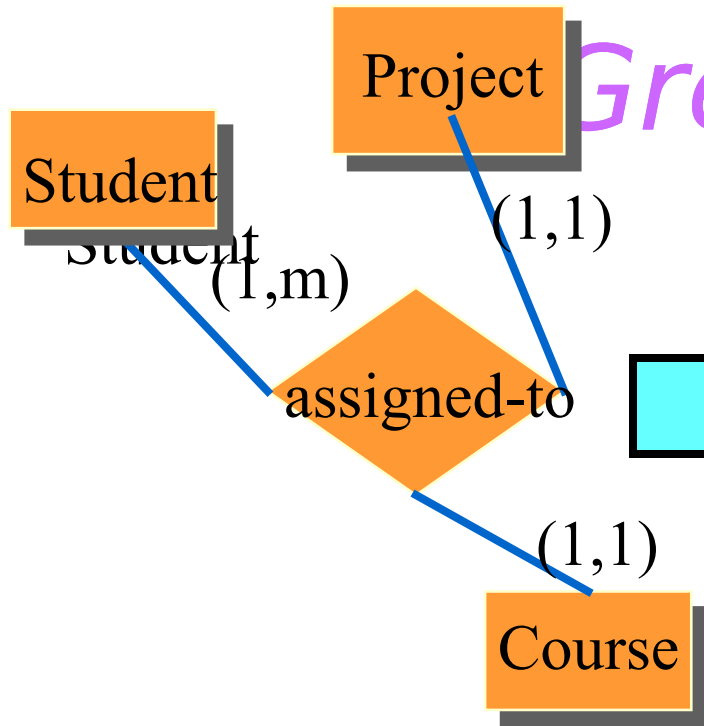

Consider Relationships Greater than Binary

SSN, Crse-ID \rightarrow Proj-ID
SSN, Proj-ID \rightarrow Crse-ID

A student is assigned to one project within each course. A student may be working on many projects but each is for a different course. There may be many students assigned to a project but each project is for a given course.

Consider Relationships Greater than Binary

Consider Relationships Greater than Binary

Proj-ID, Engin-ID \rightarrow Mgr-ID

Consider Relationships Greater than Binary

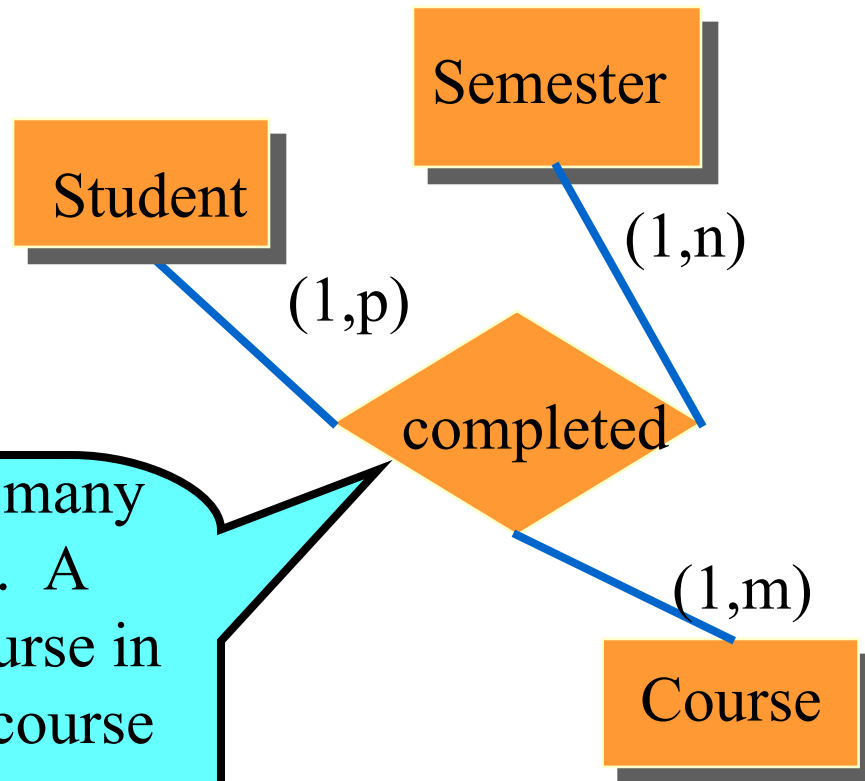

manages

<u>Proj-ID</u>	<u>Engin-ID</u>	Mgr-ID
PK	PK	
FK	FK	FK

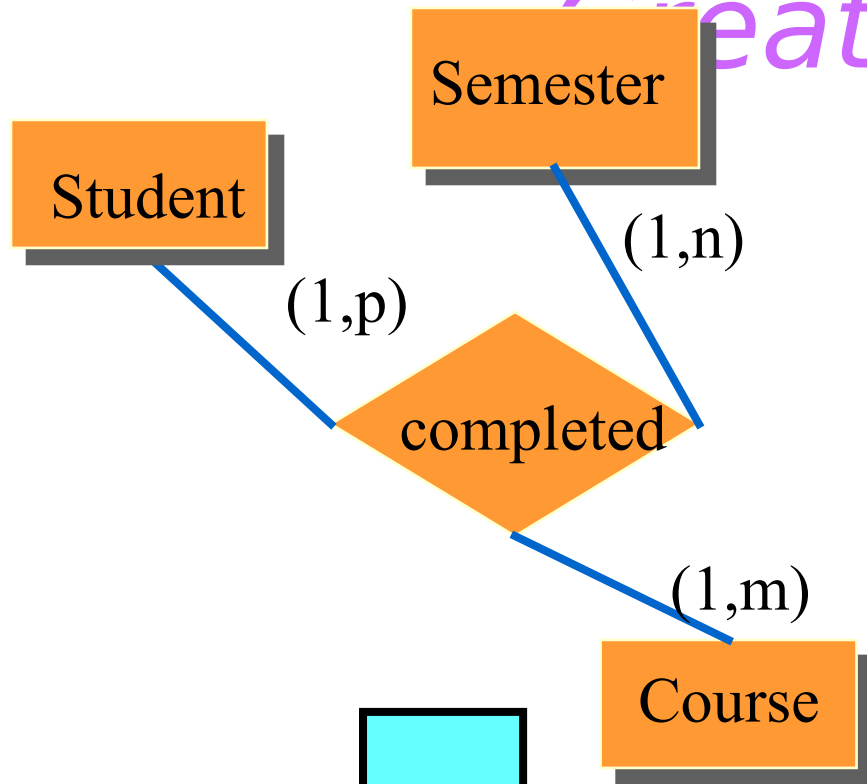

Consider Relationships Greater than Binary

No functional dependencies
between entities.

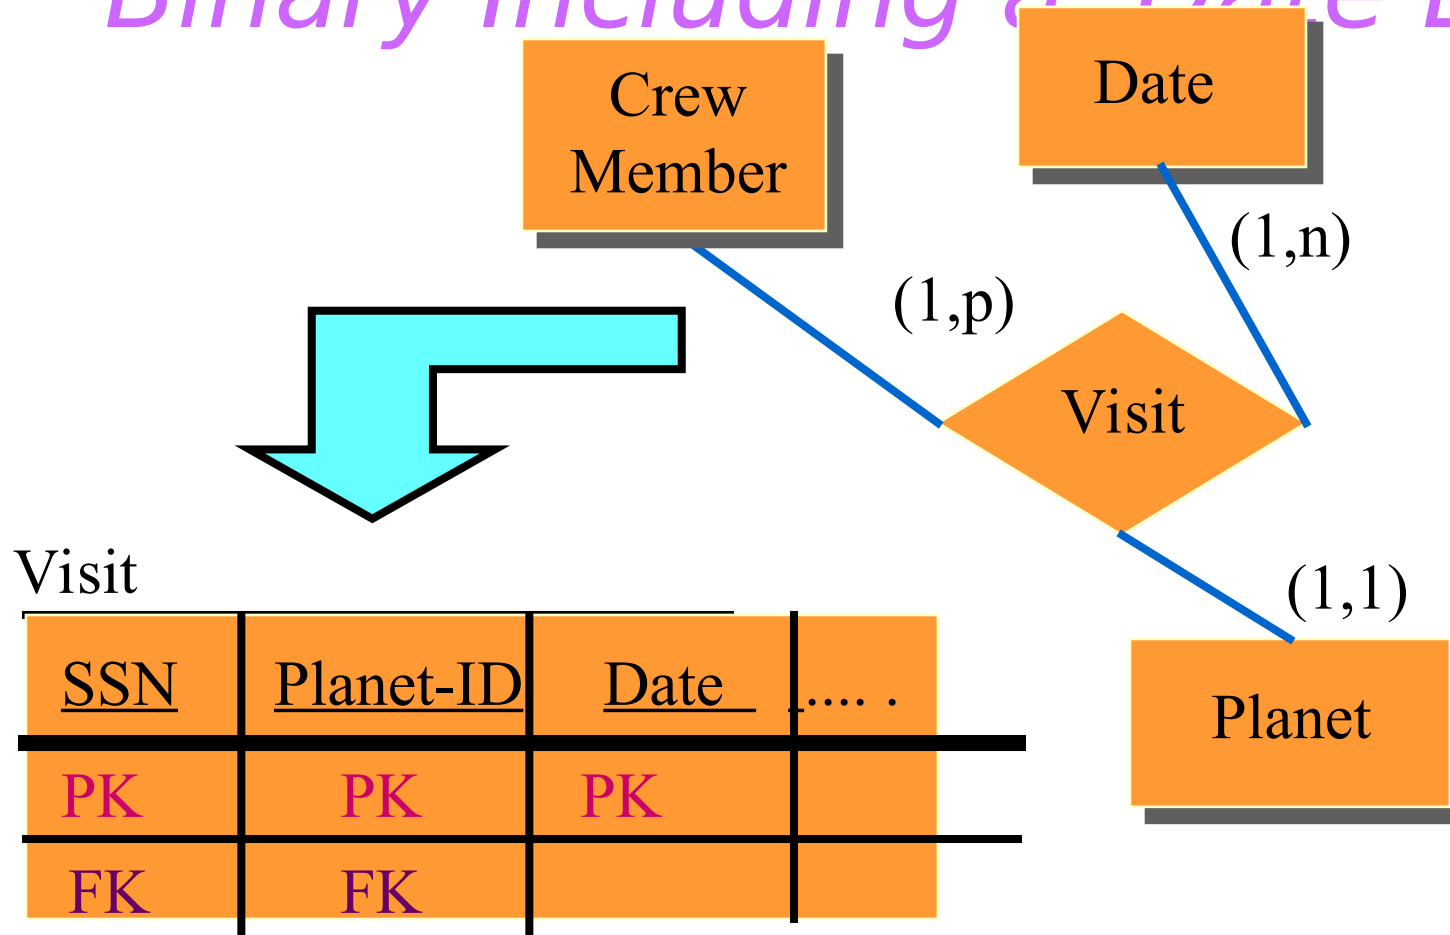

A student can complete many courses in a semester. A student may repeat a course in different semesters. A course can have many students enrolled in it in a semester.

Consider Relationships Greater than Binary

completed		
<u>Stud-ID</u>	<u>Crse-ID</u>	<u>Sem-ID</u>
PK	PK	PK
FK	FK	FK

Consider Relationships Greater than Binary Including a Date Entity

Consider Relationships Greater than Binary Including a Date Entity

Notice Date is NOT a foreign key in the Visit table. (If it were, we would need to have a table of all dates used which is not practical.)

Visit

<u>SSN</u>	<u>Planet-ID</u>	<u>Date</u>
PK	PK	PK	
FK	FK		

Consider Recursive Relationships

- Treat as the comparable type of relationship
 - one-to-many
 - use a foreign key
 - many-to-many
 - create a new relation for the relationship

Consider Recursive Relationships
